Homework 2, #2

```
% % System of equations solved by Newton's Method
% % Bhairav Mehta, MATH371 HW2 W16
%Problem 2: fn = (x-1)^2 + y^2 = 4; xy = 1
% Jacobian: 2*(x-1) 2y
            У
%%% 2a. Newton method for a convergent guess
% % fn handles, take a 2-vector x as input
fun = @(x) [(x(1)-1).^2 + x(2).^2 - 4; x(1).*x(2) - 1];
% %compute jacobian analytically
Jfun = 0(x) [2*(x(1)-1) 2*x(2); x(2) x(1)];
% % try newton's starting from 3,0 with 5 steps
x0 = [3 \ 0]'; tol=1e-10; nmax=5; verb=1;
[r,rn] = newton method nd(fun,Jfun,x0,tol,nmax,verb);
clear all;
%%% 2b. Newton method for a nonconvergent guess
%now a nonconvergent initial guess
% % fn handles, take a 2-vector x as input
fun = @(x) [(x(1)-1).^2 + x(2).^2 - 4; x(1).*x(2) - 1];
% %compute jacobian analytically
Jfun = Q(x) [2*(x(1)-1) 2*x(2); x(2) x(1)];
x0 = [3 \ 0]'; tol=1e-10; nmax=5; verb=1;
[r,rn] = newton method nd(fun, Jfun, x0, tol, nmax, verb);
clear all;
% fn handles, take a 2-vector x as input
fun = @(x) [(x(1)-1).^2 + x(2).^2 - 4; x(1).*x(2) - 1];
%compute jacobian analytically
Jfun = Q(x) [2*(x(1)-1) 2*x(2); x(2) x(1)];
%creates a meshgrid of guesses that will be used in the algorithm
[x, y] = meshgrid(-1.95 : .25 : 3.95, -1.95 : .25 : 3.95);
tol=1e-10; nmax=20; verb=1;
X = [x(:) y(:)];
figure;
clear r rn;
%starts guessing
for i=1:length(X)
    x0 = X(i,:)';
    %runs current guess
    [r(:,i),rn\{i\}] = newton method nd(fun,Jfun,x0,tol,nmax,0);
```

Homework 2, #2a output

```
% Homework 2 #2a
% |--n--|--xn---|--yn---|--|f(xn)|----|g(xn)|---|
% |--0--|3.0000000|0.00000000||0.0000000|-1.0000000|
% |--1--|3.0000000|0.3333333||0.11111111|0.0000000|
% |--2--|2.9716981|0.3364780||0.0008109|-0.0000890|
% |--3--|2.9714832|0.3365323||0.0000000|-0.0000000|>>
```

Homework 2, #2b explanation

- $\ensuremath{\$}$ No it does not converge. It says the matrix is singular to working precision
- % which means that after the first step, the Jacobian matrix is updated and % contains a row of all 0s or a column of all 0s, which makes the matrix rank deficient.
- % This happens when the determinant is = 0, which renders the matrix uninvertible.

Homework 2, #3b

```
% % HW2, 3b and Extra Credit
% % Bhairav Mehta, MATH371 HW2 W16
%creates the matrix
A = [2 3 -1; 4 4 -3; -2 3 -1];
%assigns the lower and upper matrices based on matlabs lu fn
[L, U, p] = lu(A, 'vector');
%original b
b = [5 3 1]';
```

```
%permuted b
bp = b(p);
%solving with forward and backwards substituion.
y = L \ ;
x = U \setminus y;
%the error and resuidual are both equal to 0 in this example.
%the example below is for extra credit, and we will be able to see
%when the error and residual are NOT equal to zero.
clear all;
%creates the matrix
A = [2.5 \ 3 \ -1; \ 4 \ 4 \ -3; \ -2 \ 3 \ -1];
%assigns the lower and upper matrices based on matlabs lu fn
[L, U, p] = lu(A, 'vector');
%original b
b = [5 \ 3 \ 1]';
%permuted b
bp = b(p);
%solving with forward and backwards substituion.
y = L \bp;
x = U \setminus y;
```

Homework 2, Extra Credit Explanation

```
% After a row reduction step, a value started to approach zero in the matrix
% introducing error into the system.
% As the calculations containued, the error snowballed, which is why
% both the error and residual are non zero.
%
```
